

# MK Glow Free

In order to use MK Glow, add the MK Glow Free component to your rendering camera.

If possible, always use a **Linear Color Space, Color Grading and HDR** to get the **best** results.

## 1.0 Setup Workflow

### 1.1 Threshold

The Threshold Workflow is based on the brightness of the pixels and a threshold value.

1. **Setup your threshold.** The left part of the threshold slider defines your color cutoff, while the right part defines your maximum brightness of the resulting glow. Threshold values are represented in the gamma space.
2. **Adjust the Emission.** You can simply raise the emission on your materials to make them glow.

### 1.2 Selective

The Selective Workflow allows you to apply a glow effect per object. This workflow is based on Unity's Replacement Rendering feature (not available in custom render pipelines (LWRP, HD)).

1. **Set your Render Layer.** Controls which layers are redrawn by the Replacement Rendering feature. The recommended setting for the selective Render Layer is *"Everything"* to avoid Z-Issues.
2. **Apply a *"MK/Glow/Selective/"* shader** to the material that is supposed to glow. All shader features are using the exact same raw glow map. The raw glow map can be viewed, by setting the debug view to *"raw"*.
3. **Adjust your glowing material.** Add a glow texture to define which parts should glow and setup the material as you wish.

## 2.0 Debugging

For debugging you have the DebugView option on the inspector. You can inspect every rendering step which is done while rendering.

None:	Normal rendering is done
Raw Bloom	Shows the parts, which are glowing
Bloom	Shows the final rendering step of the bloom
Composite	Shows the combined final result

## 3.0 FAQ

**Q: MK/Glow/Selective/Standard Shader is not visible or throwing a MetaPass Error**

**A:** Fix: Right Click on the “\_MK/Glow/Shaders/VariantsSelective” folder and select “reimport”

**Q: How to make Screen Spaced UI glow**

**A:** In order to make Screen Spaced UI work, your Render Mode of the Canvas has to be set to “Screen Space - Camera”, otherwise no Post-processing is applied to Screen Spaced Elements.

## 4.0 Feedback / Get in touch

**Do you have some cool stuff to show?**

I would love to see your results (High resolution screenshots / videos) using the shader!

**Questions, bug reports, feature requests, feedback:**
